investing in rural areas

Today's farm walk

Stop 1

Introduction to the farm & the ARCZero Project

Roger Bell, ARCZero

Stop 2

Benchmarking Green House Gas Emissions

Michela Tener & Stephen Flanagan, CAFRE

Stop 3

Multi-Species Swards

John Gilliland, ARCZero

Stop 4

Benchmarking Above & Below Ground Carbon

*Patrick Casement, ARCZero
& Paul Williams, Queen's University*

Stop 5

The Importance of Measurements to Flock Performance & Take Home Messages

Roger Bell & Jonathan Birnie, ARCZero

The journey towards Net Zero

John Gilliland
ARCZero Chair

Whether these are your first tentative steps, or part of an ongoing journey towards NetZero I want to thank you for taking some valuable time out to join us at the first ARCZero Farm walk.

With the Climate Change bill now law, it's essential that we understand not only what carbon is emitted on farm, but just as importantly how farms capture it too, ensuring a bright future for the next generation.

The recently announced

Soil Health & Nutrient Scheme will provide some of the information you'll see here today and will be an essential tool to help every farmer in the country to improve both their environmental and production efficiency. We hope today will help you understand just how powerful having such detailed information at your fingertips can be.

I would like to take this opportunity to thank the speakers from Queen's University and CAFRE who have given up their time to be a part of today's walk. Expertise such as theirs has been invaluable during this project.

ARCZero is a farmer-led European Innovation Project co-funded by the European Agricultural Fund for Rural Development (EAFRD) and the Department of Agriculture, Environment and Rural Affairs (DAERA).

Welcome to Springmount!

Hilary & Roger Bell
ARCZero Farmers

Welcome to Springmount! It's our great pleasure to welcome you to our sheep farm.

We have a combination of 500 lowland and upland ewes on a rotational grazing system here in Kells, County Antrim on our 78-hectare farm, operating on a rotational and strip grazing system.

Over the last 15 years, the grassland on the

farm has been drained, reclaimed and re-seeded to improve grass quality.

To ensure healthy flocks, we record the liveweight gain of all animals on the farm, benchmark every year, operate a veterinary herd/flock health plan and perform soil sampling on the farm annually, using recorded data to make informed management decisions.

We were delighted to be asked to be part of the ARCZero project, helping to give farming a positive message about the carbon being sequestered in our soils, trees and hedgerows which you will hear about today.

Please enjoy your time on our farm, we hope you come away with a great story to tell, and plenty to think about!

78 hectare farm

The ARCZero Team

ARCZero: the journey so far

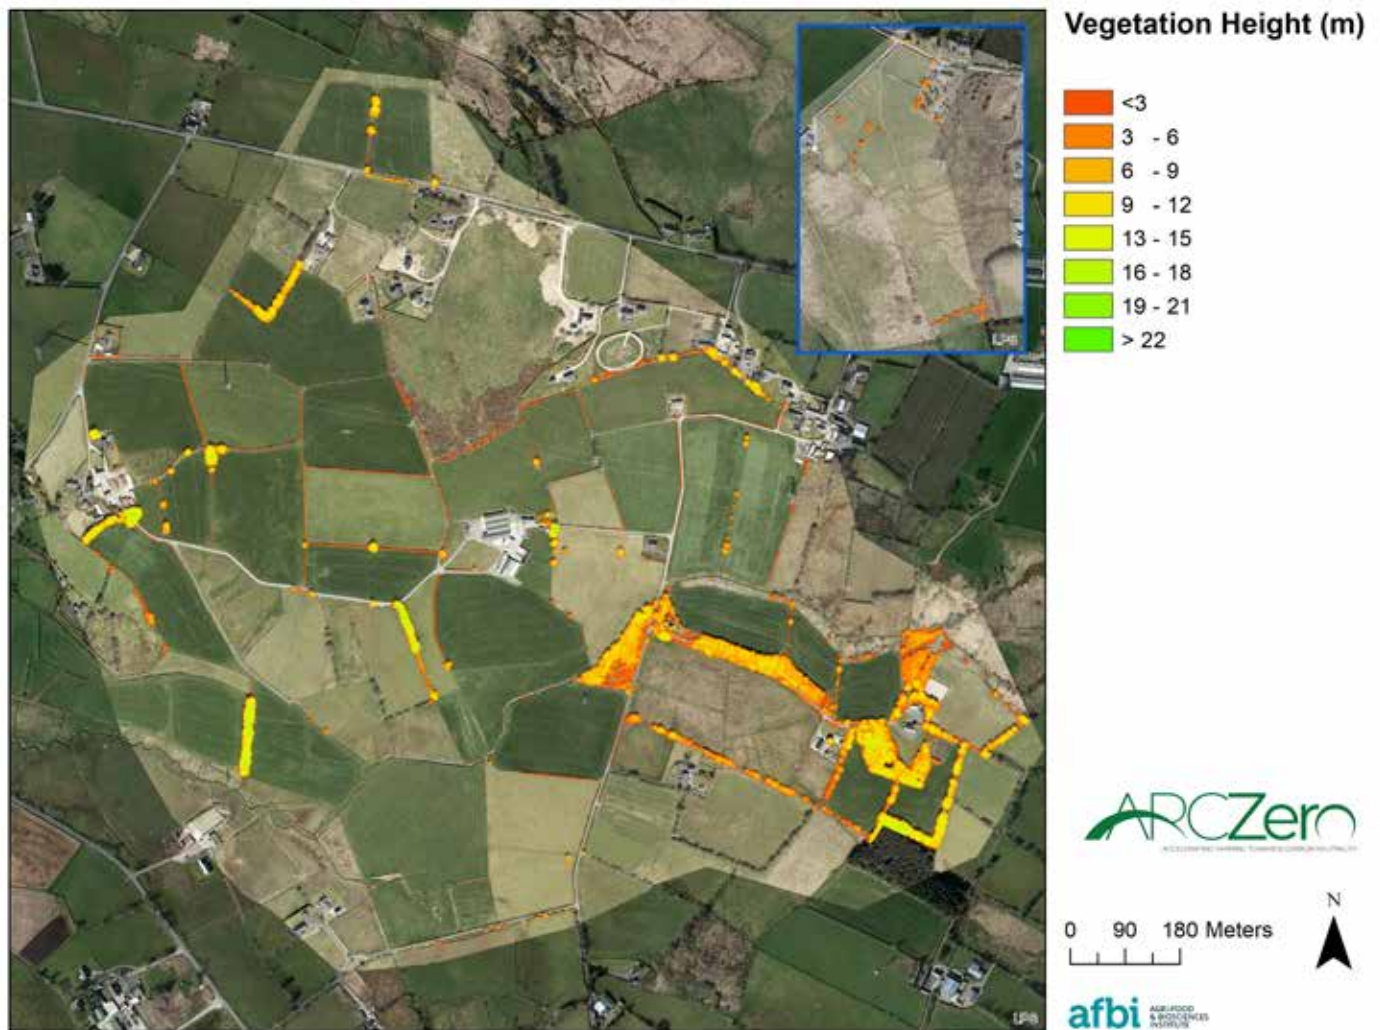

Accelerating Ruminant Carbon Zero (ARCZero) is a farmer led European Innovation Partnership project.

The project is led by John Gilliland of Brook Hall Estate and of Devenish Nutrition, alongside six other N. Ireland farms. Partners include Agrisearch, Birnie

Consultants, Devenish and Queens University Belfast, supported by AFBI, CAFRE, NRM, RPS and SRUC

ARCZero is designed to accelerate the pathway to carbon zero farming by measuring and managing carbon flows at individual farm level, and empowering farmers to make positive change.

The project aims to deliver actual individual net farm GHG footprints, carbon stocks and their potential for annual carbon sequestration, enterprise specific life-cycle analysis (LCA) calculators, and a whole farm carbon balance sheet through the precise measurement of the on-farm carbon

Aerial Lidar coverage of Springmount.

stocks within soils, trees and hedges. The project is designed to enable participating farmers to change practice to accelerate their farm's progress to carbon zero by bringing transparency to their current footprint.

To date, the project has conducted two sets of soil sampling for each farm, the first to obtain information on pH (in water, 1:2.5 volume ratio of soil to water), Phosphorus (Olsen) (1:20 volume ratio of soil to sodium

bicarbonate), Potassium (1:5 volume ratio of soil to ammonium acetate or ammonium nitrate), Magnesium (1:5 volume ratio of soil to ammonium acetate or ammonium nitrate) and Organic Matter by Loss on Ignition (LOI).

The second sampling was a Soil Carbon Audit, sampled to 10cm with information on Bulk Density, Inorganic Carbon, Total Carbon, Total Nitrogen, C:N Ratio,

Organic Matter, Soil Organic Carbon, Active Carbon (mg/kg) and Active Carbon (% of SOC). Alongside soil sampling, a full LiDAR survey was conducted with leaf off the trees, from which carbon stocks of all the trees and hedgerows on each farm was calculated. Using SRUC's 'AgReCalc' tool, this allowed a full carbon balance sheet for each farm to be divided from both the inputs and outputs.

- Technology Innovation Farm
- Multi-Species Swards for Beef & Sheep EIP Farmer

Carbon Farming

If you can't measure, how can you manage?

Gross Annual GHG Emissions
Less Gross Annual Carbon Sequestration
= Net Farm Carbon

Using “Net” not “Gross” Emissions
to get a complete picture
of carbon footprint

Carbon Footprinting as a management tool

Springmount Case Study

“ A Carbon Footprint is the total greenhouse gas emissions caused by an individual, organisation, service or product, within a given year, expressed as carbon dioxide equivalent, CO₂e”

Carbon Trust

Farm: 21.99
kg/CO₂e/kg DW

Average 30.70
kg/CO₂e/kg DW

Sources of Emissions by %

Why is it important?

- > Understanding of GHG emissions
 - > Farm business sustainability
 - > Market food products
- > Slow the rate of climate change

Springmount moving Towards Net Zero

Mitigation tools

Multi-Species Swards for Beef and Sheep EIP Project

- Learnings so far:**
- Each farm is unique – a specific MSS seed mix to suit each farm
 - Swards established in the spring have coped well in the dry weather
 - Some seed mixes have fared better than others
 - Weeds will be a feature - different management perspective needed
 - Establishment of MSS is not simple –patience required
 - The group has been invaluable for farmer support during the establishment process
 - Significant research gaps still exist

Delivering Multiple Goods by switching to Multispecies Swards

**Carbon Intensity of Beef & Lamb
per Sward Type**

- 65% Reduction in Nitrogen
- 20% Improvement in ADWC
- 300% Increase in earthworms
- 14 times faster water infiltration of soil

A 26% reduction in GHG intensity per kg of meat, without recognition of increases in soil carbon...
